                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLO1840-ABLI6175) and the encoded proteins (ABB1737-ABB72072).
                                                                                                                                                                                                                                                                                                                                  3607
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid genes from Drosophila and interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2001-656860/75.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorder e.g. arteriosclerosis, cancers; autoimmune/inflammatory disorder, AIDS, allergies, anaemia, asthma; cardiovascular disease e.g. congestive heart failure, ischaemic heart disease; developmental disorder e.g. renal tubular acidosis, hypothyroidism; neurological disorder e.g. Alzheimer's disease, dementia, Parkinson's disease, epilepsy or stroke. The SECP polynucleotide and polypeptide are further useful for analysing the proteome of a tissue or a cell type. The polynucleotide is useful for creating knockin humanised animals (pigs) or transgenic animals (mice or rats) to model human disease, and for somatic or germline gene therapy, and further for generating hybridisation probes useful in mapping the naturally occurring genomic sequence. This polynucleotide sequence represents the DNA of a human secreted protein of the invention.

The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, ar pharmaceutical compositions and vaccines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising; (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a computer readable medium which has the nucleotide sequences SEO ID NO:1 to 391 (AAV5214 to AAV52524) recorded on it, or a representative fragment or a sequence at least identical to SEO ID NO: 1 to 391. The nucleotide sequences depicted SEO ID NO: 1 to 391 to AAV52524) are genomic fragments from SEO ID NO: 1 to AAV52134 to AAV52524) are genomic fragments from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Streptococcus pneumoniae. The present invention also describes an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ö.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-09-889-314-2 (1-496) x ABA09498
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

Claim 1; Page 968-969; 1963pp; English

cc sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and convention also relates to vectors and recombinant host cells comprising a nuclectide of the invention, methods of producing the novel polypeptides, and the polypeptides in a sample, and methods of identifying compounds which comprising a represent nucleic additions the novel polypeptides, corpolypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention although novel many of the corpolypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; including cytokine, cell proliferation or cell differentiation activity; activin or inhibin-related activities; chaematopolesis regulatory activity; tissue growth activity; corpolated in oncogenesis, cancer cell proliferation or metastasis.

Cc involved in oncogenesis, cancer cell proliferation or metastasis.

Cc pepending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

CC (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in CC the specification. The proteins have antibacterial and antiinflammatory CC activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and CC antibodies that bind (I) are used in the manufacture of medicaments for CC the treatment or prevention of infection or disease caused by CC Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. CC Nucleic acids encoding (I) are used to detect Streptococcus in a CC biological sample. (I) is used to determine whether a compound binds to CC biological sample. (I) is used to determine whether a compound binds to CC used as a vaccine or diagnostic composition. The disease caused by CC used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be maningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity corrections.

The polynucleotides are useful for improving the properties of microbes used in the manufacture of milk-derived products such as cheeses, yogurt, fermented milk products, sour milks and buttermilk; in modifying the flavour, aroma, texture and health-related benefits of milk-derived products and in increasing the survival of microbes during industrial fermentation processes. The bacteria may be used to increase resistance to enteric pathogens and anti-infection activity, including treatment of rotavirus infection and infantile diarrhoea; aid in lactose digestion; as anti-cancer and anti-mutagenesis; liver cancer reduction; reduction of small bowel bacterial overgrowth; remune surface modulation.

                                                                                                                                              sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance.
                                                  Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system a which are not antigenically variable or at least more conserved than
Sequence 1437668 BP;
                                                                                                                                                                                                                                                                                                                                                                Neisseria DNA sequences and their corresponding proteins; AAA81254 (AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF
                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAB25620 to AAB25663 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 7; Page 866-1272; 1760pp; English

```

The present invention describes the full length genome of Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 CC Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 CC to AAF21613 represent fragments of the NMB genomic sequence, as the CC sequence was too long to go in a record on its own it was split into 8 CC sequences which overlap each other at the beginning and end of each CC sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at CC the beginning of AAF21607, the last 49980 bp of AAF21547 are repeated at CC the beginning of AAF21608, and so on). AAF21545 to AAF21588 encode the CC expressor proteins given in AAB58550 to AAF21545 to AAF21589 to CC AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have CC expressor proteins and can be used in vaccines and gene therapy. CC expressor proteins and/or antibodies which binds to the CC proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the bacteria. Computers, computer memory, computer storage medium or computer CC databases can be used in a search to identify open reading frames (ORFS) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins which are

This protein induces apoptosis by binding to interleukin-1-beta converting enzyme (ICE). A claimed method of inducing apoptosis in a eukaryotic cell, thereby killing the cell, comprises: (a) providing to a cell to be killed a DNA molecule (I) in expressible form which encodes the Shigella IpaB protein or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Shigella IpaB protein induces apoptosis by binding to interleukin-1-beta-converting enzyme - useful for treating cancer, auto-immunity, inflammation, etc. by eradication of unwanted cells

                                                                                         which consists of 15 silent vls cassettes (vls2-vls16) and an expressed vlsE gene (see AAT85043). Portions of several of the 15 silent vls cassette sequences, located approx. 500 bp upstream of vlsE, recombine into the central vlsE cassette region during infection, resulting in antigenic variation of the expressed lipoprotein (see AAW22676) and hence immune evasion, long-term survival and pathogenesis in the mammalian host. Nucleic acids, survival and pathogenesis, encoding VMP-like proteins, can be including vls2-vls16 sequences, encoding VMP-like proteins, can be used for the recombinant production of VMP-like proteins, or for the diagnosis of Lyme disease (claimed), and may also have application in DNA vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               28-AUG-1997.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO9731123-A1
                                                                                                                                                                                                                                                 This DNA sequence comprises the variable major protein (VMP)-like sequence (vls) locus of Borrelia burgdorferi. An infectivity related 28-kb linear plasmid, pBB28La, of B. burgdorferi B31 was isolated by subtractive hydridisation. It contained the vls locus,

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGHT6-ABLIGHT7), expressed DNA sequences (ABLIGHT8-ABLIGHT9) and the encoded proteins (ABB7737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila; developmental biology; cell signalling; insecticide;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mediated immune response involves providing a reservoir or other supply in the subject's body so that a SIBLINGS protein can be dispersed to interfere with complement mediated lysis and inflammation. This protects cells that are grafted onto foreign tissue or bone marrow cells introduced into a foreign host. The SIBLINGS protein can be BSP, OPN, DMP1 or DSPP. A method of detecting a SIBLINGS protein in a sample from a subject suspected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of DNA encoding human dentin sialophosphoprotein (DSPP, see AAB19772), a member of the small integrin binding ligand, N-linked 91ycoproteins (SIBLINGS) family. The invention provides methods and compositions for exploiting the discovery that members of the SIBLINGS family bind to complement Factor H, conferring resistance to complement mediated lysis. A claimed method of conferring protection against a complement
                                                            6814
                                                                                                                                                                                                                 6694
                                                                                                                                                                                                                                                                                                                                                                    6574 GACAGCAGTGATAGCGACAGCAGCAATAGCAGTGACAGCAGTAATAGTAGTGACAGCAGC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     11349
Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the
                                                                                      The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV5214 to AAV52524) recorded on it, or a representative fragment or a sequence at least identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted SEQ ID NO:1 to 391 (AAV52334 to AAV52524) are genomic fragments from
                                                                                                                                                                                                                        Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, pharmaceutical compositions and vaccines for Streptococcus
